

Charging pile optical cable

Article Overview

Charging pile optical cables combine power transmission and optical communication to support electric vehicle charging and smart data transfer.

Overview

Charging pile optical cables are specialized cables designed for electric vehicle (EV) charging stations, integrating both electrical power conductors and optical fibers for data communication. This dual functionality allows the cable to transfer electricity to the EV battery while simultaneously transmitting control and monitoring signals for smart charging systems, enabling advanced features like remote monitoring, load balancing, and communication with the grid .

Structure and Components

A typical optical fiber compound charging pile cable includes:

- Power wire core: Conductors made of super soft stranded copper, insulated with polyurethane or silicone rubber, usually with at least three cores for AC or DC power transmission .
- Light unit: Optical fibers embedded within the cable for transmitting data signals.
- Cable core filling reinforcement: Material filling the space between power and light units to maintain structural integrity.
- Lapping layer and sheath: Protective layers providing mechanical strength, flexibility, and resistance to environmental factors.
- Armour and oversheath: Additional layers for tension resistance, compression resi...
