

Construction site electrical box three-level distribution box

Article Overview

A three-level distribution box system at construction sites distributes power from the main source to individual equipment through main, sub, and switch boxes, ensuring control, protection, and safety at each level.

Overview of the Three Levels

First-Level Distribution Box (Main Distribution Box) This is the primary hub of the construction site power system, usually installed near the incoming power source. Its main functions are to receive electrical energy, distribute it to lower-level boxes, and provide centralized monitoring. Typical equipment includes the main circuit breaker, main leakage protector, voltmeter, and ammeter. It allows electricians to manage the entire site's power safely and efficiently, and its design often includes rainproof tops and copper busbars for reliable connections . **Second-Level Distribution Box (Sub-Distribution Box)** Installed near areas with concentrated power consumption or large equipment, the second-level box receives power from the main box and redistributes it to third-level boxes. It typically contains branch circuit breakers and branch leakage protectors to protect individual circuits. These boxes are often located within 30 meters of the equipment they serve, and fixed equipment like tower cranes or construction elevators may have dedicated sub-boxes, while temporary facilities may share a single box . **Third-Level Distribution Box (Switch Box)** The third-level box is the final junction point, directly supplying power to individual electrical equipment or groups of similar devices. It contains isolation switches, circuit breakers, and leakage protectors for direct control and protection. Each switch box generally serves only o...
