

Does cable tray installation require threading

Article Overview

Cable tray installation does not inherently require threading, but threaded rods are commonly used for supporting trays, and pre-threading nuts can simplify installation.

Threaded Rods in Cable Tray Installation

Cable trays are typically supported using hangers, struts, or threaded rods, depending on the system design and load requirements. Threaded rods are often used to suspend trays from ceilings or structural members, providing adjustable support for proper alignment and elevation. While the rods themselves must be threaded to accept nuts and secure the tray, the cable tray components do not require threading; they are usually bolted or clamped to the support hardware.

Pre-Threading Practices

For large-scale installations, pre-threading nuts onto the rods before installation is a common practice. This can be done manually or with a drill to speed up assembly and ensure proper placement of the tray supports. Pre-threading helps avoid delays caused by starting nuts on rod ends that may have been cut improperly and ensures that the tray system remains structurally sound during installation.

Compliance and Safety

All cable tray installations must comply with NEC Article 392 and local electrical cod...
