

# How to place the secondary distribution box

## Article Overview

A secondary distribution box should be installed in a dry, accessible location near the load it serves, with proper clearance and compliance with electrical codes.

### Key Placement Considerations

**Proximity to Load:** The subpanel should be located close to the area or equipment it will serve, such as a basement, workshop, or garage. This minimizes long cable runs and reduces voltage drop while improving efficiency and safety . **Accessibility:** Ensure the subpanel is easily accessible for electricians and maintenance personnel. It should not be blocked by furniture, storage, or other obstacles. Accessibility is crucial for routine inspections, troubleshooting, and emergency shutoff . **Clearance Requirements:** According to the National Electrical Code (NEC) Article 110.26, maintain a minimum of 3 feet of clear working space in front of the panel, at least 30 inches wide, and extending from the floor to a height of 6.5 feet. This ensures safe operation and maintenance . **Environmental Protection:** Avoid damp, wet, or excessively hot areas. For outdoor installations or high-humidity environments, choose a distribution box with appropriate IP or NEMA ratings to protect against water and dust ingress. Keep the panel away from flammable, explosive, or corrosive substances . **Height and Mounting:** Typically, the subpanel is mounted at a height of around 1.5 meters (5 feet) from the floor for convenient access. Ensure the mounting surface is stable and the box is level and secure . **Surge Protection Considerations:** If surge protection devices (SPDs) are used, place Type 2 SPDs after the main breaker and Type 3 SPDs close to sensitive equipment. Maintain proper spacing between SP...
