

Light Pen and Light Power Meter

Article Overview

A standard light power meter cannot function as a traditional light pen, but some specialized devices combine optical power measurement with a red light pen for visual tracing.

Light Pen Functionality

A light pen is a computer input device that detects light emitted from a CRT screen to determine its position on the display. It contains a photosensitive component, such as a photodiode, which senses the bright spot created by the CRT's electron beam. The pen communicates timing signals to the computer, allowing precise selection or drawing on the screen. Light pens rely on the rapid scanning of CRT pixels and are not designed to emit light themselves; they only detect it .

Light Power Meter Functionality

A light power meter is primarily used in fiber-optic applications to measure the intensity of light signals and test fiber continuity. Some modern handheld devices, like the Y3 series, integrate a red light pen (visual fault locator) alongside the power meter. This allows technicians to visually trace fiber paths or identify breaks, but it is intended for optical cables, not computer screens .

Key Differences

- Purpose: Light pens are for interacting with CRT displays; light power meters are for measuring optical signals....
