

Port has PD connected to the switch

Overview

In a PoE pass through switch, one or more ports will be designated as PD ports and one or more ports will be designated as PSE ports. The switch can be powered through PoE connections to the PD ports while devices attached to the switch can be powered by. Power over Ethernet (PoE) pass through switches can operate as both a Powered Device (PD) and Power Sourcing Equipment (PSE). That one fact is why a wireless access point on a ceiling, an IP phone on a desk, or a camera on a wall needs no power outlet next to it: the switch port that carries its traffic also powers it. When a. This article provides a basic understanding of how Power over Ethernet (PoE) is provisioned on Cisco Meraki MS switches and includes troubleshooting procedures to help identify PoE failures on a switch or switch port. Depending on the amount of power delivered to a PoE module, there may or may not always be enough power available to connect and support PoE operation on all ports in the module.
