

The telecommunications fiber distribution box was not closed

Article Overview

Leaving a fiber distribution box (FDB) open can compromise fiber protection, network reliability, and long-term maintenance.

Function of a Fiber Distribution Box

A fiber distribution box (FDB) serves as an intermediate distribution and management point in FTTH or FTTx networks. It organizes, splits, and routes fibers from feeder cables to subscriber access points, often containing splice trays and optical splitters for structured distribution within buildings or community areas . Unlike fiber closures, FDBs are designed for frequent access, but they still require proper closure to maintain network integrity .

Risks of Leaving an FDB Open

- **Environmental Exposure:** Open FDBs are vulnerable to dust, moisture, and UV exposure, which can degrade fiber performance and lead to signal loss .
- **Mechanical Damage:** Fibers inside the box may be bent, stressed, or accidentally disconnected, increasing the risk of network faults .
- **Unauthorized Access:** Open boxes can be tampered with, leading to service interruptions or security breaches .
- **Maintenance Challenges:** An open FDB complicates troubleshooting and long-term network management, as it may be unclear which fibers are affected or misaligned .
