

Two pigtails can be fused together

Article Overview

Yes, two fiber optic pigtails can be fused together using fusion splicing or mechanical splicing to create a permanent, low-loss connection.

Fusion Splicing

Fusion splicing is the most reliable method for joining two pigtails. In this process, the bare ends of the fibers are carefully stripped, cleaned, and aligned, then fused together using an electric arc. The glass of the two fibers melts and forms a continuous strand, resulting in a nearly seamless connection with very low insertion loss (typically 0.01–0.05 dB) and minimal back reflection. Fusion splicing is ideal for backbone networks, long-haul telecom links, and any application where signal integrity is critical.

Mechanical Splicing

Mechanical splicing is an alternative method where the fiber ends are held together in a precision alignment sleeve, often with an index-matching gel. No heat is applied, and the fibers are simply aligned and clamped. While easier and faster than fusion splicing, mechanical splices generally have higher insertion loss (0.20–0.50 dB) and back reflection, making them suitable for small-scale or temporary installations.

Practical Considerations

- **Fiber Type Compatibility:** Ensure both pigtails are of the same type (single-mode or multimode) and have matching core diameters. Mixing fiber types can result in high...
