

Weight of 300 galvanized cable tray

Article Overview

A standard 300 mm galvanized steel cable tray weighs approximately 3.9–5.8 kg per meter, depending on tray type and thickness.

Weight Estimation

The weight of a 300 mm galvanized cable tray depends on its type (solid, perforated, ladder), thickness, and coating. For a typical perforated steel tray with a 50 mm side height and 1.5 mm thickness, the weight is roughly 3.9 kg/m for the tray alone . Adding a hot-dip galvanizing (HDG) coating can increase the weight by 2–4%, and including cable fill or covers will further increase the total load . For ladder-type trays, the weight is calculated based on two side rails plus rungs, with rung spacing typically 200–300 mm. A 300 mm wide ladder tray with standard rung spacing can weigh around 5.75 kg/m .

Factors Affecting Weight

- **Material Density:** Galvanized steel is typically around 7,850 kg/m³ .
- **Tray Thickness:** Increasing thickness from 1.6 mm to 2.0 mm can increase weight by about 25% .
- **Tray Type:** Solid trays are heavier than perforated trays due to the absence of open areas.
- **Covers and Accessories:** Adding lids or couplers increases the installed weight.
