

Wireless Optical Switch

Article Overview

A wireless optical switch can refer to either a network optical switch for routing light signals or a wireless peripheral like a mouse or keyboard using optical switches for fast, precise actuation.

Optical Switching in Networking

Optical switches in networking control the path of light signals in fiber optic systems, enabling high-speed data transmission without converting signals to electrical form. They are used in wavelength division multiplexing (WDM), time division multiplexing (TDM), and space division switching. Key types include:

- Space Division Switching: Routes optical signals through a matrix configuration, supporting very high bandwidth with low insertion loss.
- Wavelength Division Switching: Uses wavelength interchangers to route specific wavelengths, ideal for DWDM networks.
- Time Division Switching: Rearranges optical time slots in OTDM systems for efficient routing.
- Hybrid Switching: Combines space, wavelength, and time techniques for flexible, high-capacity networks. These switches can be controlled electronically, optically, or via hybrid methods, and are essential for modern high-speed optical networks.
